TEXAS INSTRUMENTS

Texas Instruments Incorporated

NASDAQ: TXN · United States · Semiconductors

\$267.45

Closing price, August 19, 2026 · Market capitalization \$244.2 billion

Executive Summary

Texas Instruments designs and manufactures analog and embedded-processing semiconductors that manage power and process signals inside virtually every category of electronic equipment. The investment case rests on a genuine structural cost advantage from in-house 300 millimetre wafer manufacturing, currently obscured by the heaviest capital-expenditure cycle in the company's history and a share price that, on the analysis below, appears to already assume a substantial and sustained improvement in growth and returns on capital.

Business

Texas Instruments (TI) designs, manufactures and sells analog and embedded-processing semiconductors used to manage power and process real-world signals in industrial, automotive, personal-electronics, communications and data-centre equipment. Revenue is generated by selling more than 80,000 catalogue products to over 100,000 customers worldwide, with no single end customer or product representing a material share of revenue. Industrial and automotive customers together generated 66% of 2025 revenue, and TI manufactures the large majority of its own wafers internally, principally on 300 millimetre lines in Texas and Utah.

Financial Condition

2025 revenue was \$17.68 billion, up 13.0% from a cyclically depressed 2024 but still below the \$20.03 billion peak reached in 2022. Operating margin was 34.1% and net margin 28.3% in 2025, both well below the 48–51% and 42–44% respectively recorded in 2021–2022, reflecting lower factory utilization during the capacity build-out. Operating cash flow of \$7.15 billion comfortably covered 2025 capital expenditure of \$4.55 billion, producing free cash flow of \$2.60 billion (14.7% of revenue), a figure still far below the 29–34% FCF margins TI generated as recently as 2021–2022. Net debt stood at \$12.2 billion at year-end 2025 (1.47x EBITDA), up from \$3.6 billion (0.36x) in 2021, funding the fab build-out while the dividend continued to grow.

Market Position

TI is one of the five largest analog and embedded-processing suppliers globally alongside Analog Devices, Infineon, NXP Semiconductors, STMicroelectronics, onsemi and Microchip Technology. Its principal advantage is the lowest-cost, most vertically integrated manufacturing base in the industry, built around long-lived 300 millimetre analog fabs that competitors mostly lack; its principal weakness is that this advantage currently comes with materially higher capital intensity and a correspondingly depressed free-cash-flow margin than fabless or fab-lite peers such as Analog Devices, whose FY2025 free-cash-flow margin of roughly 39% is more than double TI's.

Valuation

At the August 19, 2026 closing price of \$267.45, TI's market capitalization is approximately \$244.2 billion and enterprise value approximately \$254.6 billion. The stock trades at 40.6x trailing-twelve-month earnings, 26.7x trailing EBITDA, and 37.4x trailing-twelve-month company-reported free cash flow (a figure that was roughly 94x on FY2025 free cash flow alone, before the sharp capex-driven recovery visible in the most recent two quarters). These multiples sit above TI's own five-year historical trading range and above most direct peers on an EBITDA basis, positioning the stock for a demanding set of forward expectations.

Investment Framework

What is attractive: a durable, difficult-to-replicate manufacturing cost advantage; a 22-year record of consecutive dividend increases; a recovering revenue and margin trajectory in 2026 after a two-year industrial and automotive inventory correction; and emerging demand from AI data-centre power management.

What is concerning: free cash flow that has been depressed for four consecutive years by an unusually large capex programme; rising net debt and a declining return on invested capital since 2021; and a valuation multiple that has expanded well beyond TI's own historical norms.

What must go right: capital expenditure needs to decline as a share of revenue as the Sherman, Texas fab complex ramps, operating margin needs to recover toward or beyond its 2021-2022 range, and industrial and automotive end-market demand needs to sustain the recovery visible in the first half of 2026.

What could break the thesis: a stalled or reversed industrial/automotive recovery, continued high capital intensity without a corresponding revenue payoff, an adverse outcome in China's ongoing anti-dumping investigation into US analog chips, or a broader de-rating of semiconductor multiples.

What appears to be priced in: the reasoned discounted-cash-flow analysis in Section C5 implies a value per share well below the current market price under base and even bull-case assumptions, suggesting the market is pricing sustained double-digit growth, margin expansion beyond TI's historical peak, and/or a lower discount rate than used here, or is assigning separate strategic value to TI's domestic manufacturing base and AI-power optionality.

Investment Profile

BUSINESS QUALITY	High. Diversified analog and embedded franchise with structural manufacturing cost advantages and negligible customer concentration.
FINANCIAL QUALITY	Mixed. Investment-grade balance sheet and strong headline profitability, offset by four years of capex-suppressed free cash flow and rising leverage.
COMPETITIVE POSITION	Strong and improving. Internal 300mm manufacturing is a genuine structural cost edge as the capacity build-out matures.
GROWTH PROFILE	Cyclically recovering. Revenue troughed in 2024; 2026 year-to-date growth has been driven by industrial, automotive and data-centre demand.
BALANCE-SHEET RISK	Moderate. Net debt/EBITDA of 1.47x remains investment-grade, but has risen materially since 2021 and dividends have exceeded free cash flow in three of the last four years.
VALUATION	Demanding. Trailing multiples sit above TI's own five-year range and above most direct peers, and reasoned DCF scenarios fall below the current price.
MARKET AND TECHNICAL PROFILE	Strong upward momentum over the trailing twelve months alongside broad-based semiconductor sector strength; price sits well above both its 50- and 200-day moving averages.

A. About the Business

A1. Business Environment

Texas Instruments operates in the analog and embedded-processing segment of the global semiconductor industry. Analog chips convert and manage continuous real-world signals (voltage, current, temperature, sound, light) into and out of the digital domain, and manage power delivery across virtually every electronic system; embedded-processing chips (microcontrollers and digital signal processors) provide the low-power control logic that runs alongside them. Unlike leading-edge digital logic, which depends on the newest, most expensive process nodes, analog manufacturing economics favor mature, long-lived process technology, high product proliferation (tens of thousands of distinct part numbers), and long product lifecycles, often a decade or more.

Sourced industry estimates place the global analog semiconductor market at approximately \$93.7 billion in 2025, growing to roughly \$99–101 billion in 2026 and a mid-single-digit compound annual growth rate through the early 2030s, driven principally by vehicle electrification (battery management, motor drives, power conversion) and industrial automation and IoT sensing.¹ The industry is moderately concentrated: Texas Instruments, Analog Devices, STMicroelectronics, Infineon Technologies and NXP Semiconductors are consistently identified as the leading suppliers, alongside onsemi, Microchip Technology, Renesas and a long tail of smaller and Chinese domestic suppliers.

Reasoned: the analog and embedded-processing industry is best classified as **mature and moderately cyclical**, rather than emerging, disrupted or structurally declining. Demand growth is real but incremental, driven by unit proliferation (more sensors and power nodes per vehicle, factory and device) rather than by a step-change in end-market volume; the industry is presently emerging from a two-year inventory correction in industrial and automotive channels that suppressed 2023-2024 volumes across all major suppliers, with 2026 marking a broad-based recovery, reinforced in TI's case by incremental demand from AI data-centre power delivery.

A2. What Does the Company Do?

TI operates through two reportable segments. **Analog** (approximately \$14.0 billion of 2025 revenue, roughly 79% of the total) comprises Power products, which manage voltage and current across a system, and Signal Chain products, which sense, condition, and convert real-world signals. **Embedded Processing** (approximately \$2.7 billion, roughly 15%) supplies microcontrollers and processors that provide the control logic layer built around TI's analog content. A smaller Other category, including DLP products and licensing, accounts for the balance.² TI sells more than 80,000 individual products, mostly through direct sales and its own e-commerce channel (TI.com) supplemented by distributors, to more than 100,000 customers across industrial, automotive, personal-electronics, communications-equipment and data-centre end markets; no single customer represented 10% or more of 2025 revenue.

The economic model is straightforward: a customer designs a TI part into its product (a process called “design-in”) that, once qualified, tends to remain unchanged for the life of that product, often five to fifteen years for industrial and automotive equipment. Design-in creates high switching costs and predictable, long-duration demand once secured, but requires TI to sustain a very broad catalogue (tens of thousands of active parts) and a direct, technically capable sales and applications-engineering organization to win each design slot years before revenue is recognized.

How a Dollar Moves Through Texas Instruments (FY2025, Reported)

Stage	\$ per \$100 of Revenue	Commentary
Revenue	100.0	\$17.68bn total, ~79% Analog, ~15% Embedded Processing, ~6% Other
Cost of revenue	(43.0)	Wafer fabrication, assembly and test, largely internal 300mm/200mm capacity
Gross profit	57.0	Gross margin 57.0%, down from 67-69% at the 2021-2022 peak on lower utilization
R&D	(11.8)	\$2.08bn; funds new analog and embedded product development
SG&A	(10.5)	\$1.86bn; direct sales force and applications engineering
Operating income	34.1	\$6.02bn operating profit, 34.1% operating margin
Net interest, tax	(5.8)	\$543m interest expense on \$15.4bn gross debt; 12.4% effective tax rate
Net income	28.3	\$5.00bn, 28.3% net margin
Capital expenditure	(25.7)	\$4.55bn, principally 300mm fab construction in Sherman, Texas
Free cash flow	14.7	\$2.60bn (operating cash flow of \$7.15bn less capex); largely returned via dividends

Source: Company 10-K and cash flow statement, fiscal year 2025 (reported). Percentages calculated by the analyst on total revenue of \$17,682 million.

OPERATING MODEL FLOW

Customer design-in (industrial, automotive, personal electronics, communications, data centre) leads to Catalogue sale of Analog (Power, Signal Chain) or Embedded Processing product leads to Revenue recognized on shipment, largely from internally manufactured 300mm/200mm wafers leads to Gross profit after wafer fab, assembly and test costs leads to Operating profit after R&D and direct sales/applications engineering leads to Free cash flow after capital expenditure on fab capacity leads to Capital allocation to dividends, share repurchases and debt service.

Revenue by End Market, FY2025

Source: Company earnings disclosures, fiscal year 2025. Industrial and Automotive together represented 66% of revenue.

The most economically important step in this chain today is capital expenditure: TI is mid-way through building a network of new 300mm fabs (principally in Sherman, Texas, with the first, SM1, entering production in December 2025) as part of a stated plan to invest more than \$60 billion across seven fabs in Texas and Utah, targeting more than 90% of chip revenue from internally manufactured wafers by 2030, up from roughly 80% in 2020.³ Until that capacity is substantially utilized, depreciation and capex weigh on margins and free cash flow well in excess of what the current revenue base would otherwise require.

A3. Business and Relationship Network

TI's ecosystem is unusually self-contained for a semiconductor company of its scale, which is itself a structural feature of the business rather than an oversight.

- **Manufacturing base (largely internal):** 300mm wafer fabs in Richardson and Sherman, Texas, and 200mm/300mm fabs elsewhere in Texas; a large assembly and test operation in Chengdu, China, and other sites; internal manufacturing supplies roughly 80%-plus of wafer needs, reducing reliance on third-party foundries relative to fabless peers.
- **Equipment and materials suppliers:** semiconductor capital-equipment makers (lithography, deposition, etch, test) and silicon-wafer suppliers; TI's exposure here is diversified across many vendors given its own fab ownership, unlike fabless peers who concentrate counterparty risk in a single foundry partner such as TSMC.
- **Customers:** more than 100,000 direct and distributor-served customers spanning industrial automation, automotive OEMs and tier-one suppliers, consumer-electronics OEMs, communications-infrastructure equipment makers and, increasingly, data-centre and AI server power-supply designers; no customer concentration disclosed above a low-single-digit percentage of revenue.
- **Distribution:** a hybrid of direct sales/TI.com e-commerce and third-party distributors, weighted toward direct sales for larger accounts.
- **Capital markets and government counterparties:** TI has drawn on U.S. CHIPS and Science Act incentives and investment-grade debt markets to help fund its fab expansion, and is a large employer and taxpayer in Texas and Utah.

A4. Competition

TI's most economically relevant competitors are other broad-based analog and embedded-processing suppliers competing for the same design-in slots, capital and engineering talent, rather than the full universe of companies classified under the same GICS sub-industry.

Company	What They Sell	Manufacturing Model	FY Revenue	Gross Margin	Relative Position vs. TI
Analog Devices (ADI)	Broad analog, RF, power and precision signal-chain	Hybrid internal/foundry ("fab-lite")	\$11.0bn (FY25)	69.3%	Higher margin and far higher FCF conversion (~39% FCF margin); less capital-intensive but less vertically integrated than TI
STMicroelectronics	Analog, power discrete, microcontrollers, automotive	Mostly internal (Europe/Asia fabs)	\$11.8bn (2025)	33.9%	Weaker profitability through the current cycle; heavier automotive/China exposure; margins well below TI
Infineon Technologies	Power semiconductors, automotive, security	Mostly internal (Europe, Asia, Villach 300mm)	€14.66bn (FY25)	~41%	Automotive/power-discrete leader; different product mix (more power discretes, less general-purpose analog) than TI
NXP Semiconductors	Automotive processing, secure connectivity, RF	Hybrid internal/foundry	\$12.27bn (2025)	54.7%	Stronger automotive-processor franchise; less broad analog catalogue than TI
onsemi	Power discrete/module, automotive and industrial sensing	Mostly internal	\$6.0bn (2025)	38.4%	More concentrated in power discretes and image sensing; smaller scale, weaker margins currently
Microchip Technology	Microcontrollers, analog, FPGAs	Mostly internal	\$4.4bn (FY25)	57.0%	Smaller, more MCU-weighted; went through a severe FY2025 inventory correction (revenue -42% YoY)
Chinese domestic suppliers	Commodity analog and interface ICs	Mostly foundry-based, subsidized capacity	N/A (fragmented)	N/A	Emerging low-cost competitors in commodity, mature-node analog; benefit from Chinese anti-dumping action against U.S. suppliers

Sourced: company earnings releases and regulatory filings for the periods stated; STMicroelectronics figures are calendar-year 2025; Infineon figures are fiscal year ended September 2025. Gross margin is GAAP as reported for TI, STMicroelectronics and NXP; ADI's figure is the company's adjusted (non-GAAP) gross margin of 69.3% (GAAP gross margin was 61.5%); onsemi and Microchip figures are non-GAAP as reported by those companies. Figures are not restated to a common accounting basis and should be read as directionally comparable rather than precisely equivalent.

Peer Revenue Comparison, Latest Reported Fiscal Year

Source: company earnings releases (see Section G). Infineon converted from euros at an approximate EUR/USD rate of 1.08.

Peer Gross Margin Comparison, Latest Reported Fiscal Year

Source: company earnings releases (see Section G). ADI figure is adjusted/non-GAAP (69.3%; GAAP was 61.5%); onsemi and Microchip figures are also non-GAAP as reported by those companies; TI, STMicroelectronics and NXP are GAAP.

TI does not compete meaningfully with leading-edge digital logic or memory suppliers (for example, NVIDIA, TSMC as a foundry, or Samsung/SK Hynix in memory), which serve different economics and customer relationships; those companies are best understood as complements (TI supplies power and interface chips into AI servers) rather than substitutes.

A5. Competitive Differences

Advantages. TI's central structural advantage is internal 300mm analog wafer manufacturing at a scale most competitors cannot match: 300mm wafers yield roughly 2.3 times the die of the 200mm wafers still used by much of the industry at a modestly higher processing cost, giving TI a durable per-unit cost advantage once a given fab is fully utilized.³ This is reinforced by an extremely broad catalogue (tens of thousands of parts), a direct sales and applications-engineering organization that most fabless competitors cannot replicate at the same scale, and design-in switching costs that lock in demand for the life of a customer's product. A 22-year record of consecutive dividend increases also signals confidence in long-run cash generation to income-oriented shareholders.

Disadvantages. The same vertical-integration strategy that creates the long-run cost advantage requires TI to carry far more capital intensity than fabless or fab-lite peers, and that capital intensity is presently depressing free cash flow and return on invested capital while new fabs ramp toward utilization. TI also carries meaningful China revenue exposure (approximately 20% of revenue from China-headquartered customers) at a moment when Chinese authorities have opened an anti-dumping investigation specifically targeting U.S.-made analog chips, TI included.⁴ Personal-electronics end demand, roughly a fifth of revenue, is also more commoditized and price-competitive than the industrial and automotive franchise.

Reasoned: TI's moat is best classified as **Moderate-to-Strong and structural** in its industrial and automotive analog and embedded franchise (durable manufacturing cost advantage, design-in switching costs, direct sales scale), but currently understated in reported returns because of a temporary, self-inflicted capital-intensity headwind from the fab build-out. The distinction matters: the manufacturing cost advantage is structural and durable; the currently depressed free cash flow and ROIC are cyclical/temporary, expected by management to improve as new capacity is absorbed by revenue growth.

A6. Industry Trend

The analog and embedded-processing industry experienced a sharp double-digit revenue contraction across most suppliers in 2023-2024 as industrial and automotive customers worked down pandemic-era inventory overbuilds; TI's own revenue fell from \$20.03 billion (2022) to \$15.64 billion (2024), a 21.9% peak-to-trough decline, before recovering to \$17.68 billion in 2025 and continuing to accelerate through the first half of 2026 (revenue up 20.8% year-over-year in H1 2026).⁵ Secular demand drivers, including vehicle electrification and increasing semiconductor content per vehicle, industrial automation, and a newly emerging data-centre/AI power-delivery market, are widely cited across the industry and by TI management as multi-year growth vectors layered on top of this cyclical recovery.

Reasoned: the current phase is best described as a **cyclical recovery within a structurally mature, moderately growing industry**. The cyclical nature is real and has recurred multiple times in TI's history; nothing in the available data suggests the industry has become structurally disrupted or is entering secular decline. The clearest risk to the recovery thesis reversing would be a renewed inventory correction, a broader macroeconomic slowdown affecting industrial capital spending and vehicle production, or an escalation of the China trade dispute that materially reduces addressable demand for U.S.-made analog chips.

A7. Management

Haviv Ilan: Chairman of the Board (2026), President and Chief Executive Officer (since 2023). Ilan joined TI in 1997 and rose through manufacturing, product-line and business-unit leadership roles, including running the Analog business, before becoming CEO. He succeeded Rich Templeton, who retired at the end of 2025 after 45 years with the company, the last 18 as CEO and Chairman.⁶

Julie Knecht: Senior Vice President and Chief Financial Officer, effective August 1, 2026. Knecht joined TI in 1999 and most recently served as Chief Accounting Officer and Vice President of Accounting and Tax since 2021; she succeeded Rafael Lizardi, who retired after 25 years with the company and led the CFO function through the fab build-out decision and the 2023-2024 downturn.⁶

Ahmad Bahai: Senior Vice President and Chief Technology Officer, responsible for TI's long-range technology and manufacturing roadmap, including the 300mm transition.

TI's senior leadership is overwhelmingly internally promoted (both the CEO and incoming CFO are TI lifers with two-to-three decades of tenure at the company), which typically correlates with continuity of capital-allocation philosophy rather than strategic discontinuity. That continuity is visible in the data: management has maintained its stated priority of returning "all free cash flow" to shareholders over time through dividends and buybacks even during the trough years of the capex cycle, funding the gap between free cash flow and cash returned to shareholders with balance-sheet debt (net debt rose from \$3.6 billion in 2021 to \$12.2 billion in 2025) rather than cutting the dividend.⁷ Institutional ownership is high (approximately 85%) and insider ownership modest (well under 1%), consistent with a mature, widely held large-cap industrial technology company rather than a founder-controlled enterprise.

B. Evaluation

B1. Financial and Operating Metrics

The five-year trend below is the central analytical fact about Texas Instruments today: profitability metrics have compressed sharply since 2021-2022, not because the underlying franchise has weakened, but because an unusually large capital-expenditure program has depressed fixed-cost absorption and cash conversion during the build-out.

Revenue and Revenue Growth, FY2021-FY2025

Source: Company financial statements (SEC filings). Calculated: YoY growth by the analyst.

Gross, Operating and Net Margin, FY2021-FY2025

Source: Company financial statements. Calculated: margins by the analyst as a percentage of reported revenue.

Net Income vs. Free Cash Flow, FY2021-FY2025 (\$M)

Source: Company cash flow statements. Calculated: FCF = operating cash flow less capital expenditure.

Return on Equity and Return on Invested Capital, FY2021-FY2025

Calculated by the analyst. ROE = net income / average shareholders' equity. ROIC = NOPAT / (total debt + equity – cash), using reported effective tax rate for NOPAT.

Return on invested capital fell from 46.9% in 2021 to 19.3% in 2025 even as reported operating profitability remained healthy in absolute terms, because invested capital (debt plus equity, less cash) grew 68% over the same period, roughly

twice as fast as EBIT. This is the clearest quantitative expression of the capex-cycle thesis: TI is presently earning a lower return on a much larger capital base, a pattern that should reverse only if the new fab capacity converts into proportionate revenue and margin growth over the next several years.

Net Debt and Net Debt / EBITDA, FY2021-FY2025

Source: Company balance sheets. Calculated: net debt = total debt less cash and short-term investments; EBITDA per company-reported figures.

Capital Expenditure and Depreciation & Amortization, FY2021-FY2025 (\$M)

Source: Company cash flow statements. Capital expenditure has run well ahead of depreciation throughout the build-out, a leading indicator of further depreciation growth (and margin pressure) as the new fabs are placed in service.

SELECTED RATIOS, FY2021-FY2025 (CALCULATED BY THE ANALYST FROM REPORTED FINANCIAL STATEMENTS)

Metric	2021	2022	2023	2024	2025
Gross margin	67.5%	68.8%	62.9%	58.2%	57.0%

Metric	2021	2022	2023	2024	2025
Operating margin	48.9%	50.6%	41.8%	34.9%	34.1%
Net margin	42.4%	43.7%	37.2%	30.7%	28.3%
ROE	58.3%	60.0%	38.5%	28.4%	30.7%
ROIC	46.9%	42.5%	25.6%	18.3%	19.3%
FCF margin	34.3%	29.6%	7.7%	9.6%	14.7%
Net debt / EBITDA	0.36x	0.57x	0.97x	1.57x	1.47x
Effective tax rate	12.9%	12.8%	12.2%	12.0%	12.4%

Effective tax rate = income tax expense / pre-tax income, as reported.

B2. Risks

STRUCTURED RISK ASSESSMENT

Category	Risk	Probability	Impact
Business	Industrial/automotive demand recovery stalls or reverses after the 2023-2024 inventory correction	Medium	High
Financial	Free cash flow remains structurally below net income if capex does not moderate as planned, pressuring the balance sheet or dividend coverage	Medium	High
Financial	Rising net debt (1.47x EBITDA, up from 0.36x in 2021) reduces financial flexibility if the cycle turns down again	Medium	Medium
Competitive	Chinese domestic analog suppliers gain share in commodity, mature-node parts, pressuring pricing	Medium	Medium
Regulatory / Geopolitical	China's Ministry of Commerce anti-dumping investigation (opened September 2025) into U.S.-made analog chips, naming TI, could result in punitive tariffs on a market representing roughly 20% of revenue	Medium	High
Technological	Underutilization of new 300mm capacity if demand growth disappoints, prolonging margin and ROIC compression	Medium	High
Macro	A global industrial or automotive production slowdown reduces unit demand across all major end markets simultaneously	Low-Medium	High
Valuation	Trailing multiples (40.6x P/E, 26.7x EV/EBITDA) sit above TI's own five-year range; any disappointment in the margin-recovery narrative could trigger material multiple compression	Medium	High

The three risks most capable of permanently impairing shareholder value are, in the analyst's judgment: (1) a scenario in which the new 300mm capacity is not absorbed by proportionate revenue growth over the next several years, permanently depressing returns on the capital already committed; (2) an adverse and sustained outcome in the China anti-dumping proceeding that structurally reduces TI's addressable China revenue; and (3) a valuation reset in which the market re-prices the stock to historical multiple ranges from a starting point of disappointing, rather than accelerating, earnings.

B3. Valuation

VALUATION MULTIPLES AT THE AUGUST 19, 2026 CLOSING PRICE OF \$267.45

Multiple	Value	Basis
Market capitalization	\$244.2bn	913.25m diluted shares outstanding × \$267.45
Enterprise value	\$254.6bn	Market cap + net debt of \$10.4bn (June 30, 2026)
P/E (trailing twelve months)	40.6x	Price / TTM diluted EPS of \$6.59
Forward P/E	27.6x–35.3x	Range across consensus estimate sources; see source note
EV / EBITDA (TTM)	26.7x	EV / TTM EBITDA of \$9.52bn
EV / Revenue (TTM)	13.1x	EV / TTM revenue of \$19.45bn
P / Sales (TTM)	12.6x	Market cap / TTM revenue
P / Book	13.7x	Price / book value per share of \$19.57 (June 30, 2026)
P / FCF (FY2025A, calculated)	~94x	Market cap / FY2025 calculated free cash flow of \$2.60bn
P / FCF (TTM, company-reported)	37.4x	Market cap / trailing-twelve-month company-reported free cash flow of \$6.53bn (through Q2 2026)
Dividend yield	2.12%	Annualized dividend of \$5.68 / price

Sourced/Calculated as noted. Forward P/E range reflects differing consensus-estimate methodologies across data providers as of the report date and is disclosed as a range rather than a single figure for that reason.

Historical valuation. Using TI's own reported diluted EPS and December closing share price for each of the last several years, the stock's trailing P/E has ranged from roughly 17x (2022 year-end, after a sharp de-rating) to roughly 37x (2024 year-end, on cyclically depressed earnings). The current 40.6x trailing multiple sits at or above the top of that five-year range, despite TTM earnings having recovered only partway back toward the 2021-2022 peak, indicating that recent share-price appreciation has been driven substantially by multiple expansion rather than earnings recovery alone.

Peer valuation. On EV/EBITDA, TI's approximately 27x compares with a peer group that includes Analog Devices at a premium multiple (reflecting its higher-margin, lower-capital-intensity model) and STMicroelectronics, Infineon, NXP and onsemi at generally lower multiples (reflecting weaker current profitability and, in several cases, greater automotive-cyclical exposure). TI is not the cheapest name in the group on a trailing basis, and its premium to STMicroelectronics, NXP, Infineon and onsemi is best explained by its structural manufacturing advantage and dividend record rather than by superior near-term profitability, which is currently below its own historical norms.

B4. Capital Market and Stock Analysis

PRICE PERFORMANCE SUMMARY (PRICED AS OF AVAILABLE DATA; SEE SOURCE NOTE)

Period	Return
1-day (Aug 18 to Aug 19, 2026)	-1.76%
Trailing 3 months (Mar 11 to Jun 11, 2026 close series)	+49.5%

Period	Return
Trailing 12 months (Dec 2024 to Dec 2025 monthly close basis)	approx. -7.5%
Year-to-date 2026 (Dec 31, 2025 close to Aug 19, 2026 close)	approx. +54.2%
52-week range	\$152.73 – \$334.03

Source: S&P Global Market Intelligence (via StockAnalysis.com) for historical closing prices; Alpha Vantage market data for the August 19, 2026 quote and 52-week range. Certain intermediate months were not independently retrievable at daily granularity as of report preparation; period returns are calculated from the closest available sourced closing prices and are labelled accordingly.

Volatility and technical structure. TI carries a beta of 1.33 versus the broader market, consistent with a cyclical, capital-intensive semiconductor manufacturer.⁸ The 50-day moving average (\$291.44) sits above the 200-day moving average (\$232.90) as of the most recent available data, a bullish long-term trend configuration, though the current price of \$267.45 sits below the 50-day average, indicating a short-term pullback within a longer uptrend. The stock has traded in a wide \$152.73–\$334.03 range over the trailing 52 weeks, reflecting both the magnitude of the 2026 earnings recovery and a broader re-rating across the semiconductor sector; the PHLX/iShares semiconductor benchmark (SOXX) rose materially over the same broad window, indicating that TI's advance has occurred alongside, rather than substantially independent of, a sector-wide rally.⁹ **Reasoned:** the technical structure (price above the 200-day average, elevated realized volatility, a wide 52-week range) is consistent with a stock in an active re-rating phase; it does not, on its own, indicate whether that re-rating is fundamentally justified, which is addressed directly in the valuation and DCF analysis above and in Section C5.

C. Financial Statements

C1. Income Statement

CONSOLIDATED INCOME STATEMENT, FY2021-FY2025 (\$ MILLIONS, AS REPORTED)

Line Item	2021	2022	2023	2024	2025
Revenue	18,344	20,028	17,519	15,641	17,682
Cost of revenue	5,968	6,257	6,500	6,547	7,599
Gross profit	12,376	13,771	11,019	9,094	10,083
Research & development	1,554	1,670	1,863	1,959	2,083

Net income	7,769	8,749	6,510	4,799	5,001
Diluted EPS (reported)	\$8.47	\$9.62	\$7.06	\$5.11	\$5.53

Source: Company 10-K filings, SEC EDGAR, as compiled and normalized by aggregated financial-data provider Alpha Vantage from company filings. EBITDA as reported/normalized by the data provider.

Revenue fell 21.9% peak-to-trough between 2022 and 2024 as industrial and automotive customers depleted excess inventory built up during 2021-2022 supply shortages, then recovered 13.0% in 2025 and a further 20.8% year-over-year in the first half of 2026 as that destocking cycle ended. **Reasoned:** the 2021-2022 growth was driven by a combination of genuine unit demand and customer over-ordering against supply constraints (price and mix contributed only modestly); the 2023-2024 decline was primarily a volume story as customers worked down that excess inventory rather than a demand-destruction event; and the 2025-2026 recovery reflects normalized order patterns catching up with underlying end-market consumption, reinforced by new data-centre power demand.

Operating leverage has been negative through the downturn and only partially positive on the way back up: operating margin fell from 50.6% (2022) to 34.9% (2024), a 1,570 basis-point compression on a 21.9% revenue decline, then improved only 20 basis points in 2025 despite a 13.0% revenue increase, because rising depreciation from newly commissioned fab capacity offset the benefit of higher volume. Gross margin has contracted every year since 2022 (68.8% to 57.0%), directly reflecting lower factory utilization against a growing fixed asset base, the clearest income-statement signature of the capex cycle.

Diluted Earnings Per Share, FY2016-FY2025 (As Reported)

Source: Company earnings releases and 10-K filings. EPS reflects a decade of cyclicalities around a rising trend, with 2022 the peak year to date and 2024 the most recent trough.

C2. Balance Sheet**CONSOLIDATED BALANCE SHEET, FY2021-FY2025 (\$ MILLIONS, AS REPORTED)**

Line Item	2021	2022	2023	2024	2025
Cash & short-term investments	4,631	3,050	2,964	3,200	3,225
Inventory	1,910	2,757	3,999	4,527	4,804
Accounts receivable	1,701	1,895	1,787	1,719	1,963
Goodwill	4,362	4,362	4,362	4,362	4,330
Total assets	24,676	27,207	32,348	35,509	34,585
Total debt (short + long-term)	8,206	9,498	11,223	15,040	15,391
Total liabilities	11,343	12,630	15,451	18,606	18,312
Shareholders' equity	13,333	14,577	16,897	16,903	16,273
Net debt (total debt less cash & STI)	3,575	6,448	8,259	11,840	12,166
Net debt / EBITDA	0.36x	0.57x	0.97x	1.57x	1.47x

Source: Company 10-K filings; net debt and leverage ratios calculated by the analyst.

The balance sheet remains investment-grade by any conventional measure: 4.35x current ratio and 1.47x net debt/EBITDA at year-end 2025, but the trend is the more informative signal than the level: total debt has grown 88% since 2021 while equity has grown only 22%, and inventory has grown 151% against a revenue base that is still below its 2022 peak. The inventory build (from \$1.91 billion to \$4.80 billion since 2021, a period in which revenue fell) is a genuine yellow flag worth monitoring; management has characterized part of this build as a deliberate strategic buffer tied to the new internal capacity, but a sustained further rise without a matching revenue recovery would point to demand rather than strategy as the

explanation. No off-balance-sheet financing vehicles, unusual related-party structures or pension funding gaps were identified as material to the analysis.

C3. Cash Flow Statement

CONSOLIDATED CASH FLOW STATEMENT, FY2021-FY2025 (\$ MILLIONS, AS REPORTED)

Line Item	2021	2022	2023	2024	2025
Operating cash flow	8,756	8,720	6,420	6,318	7,153
Capital expenditure	2,462	2,797	5,071	4,820	4,550
Free cash flow (calculated)	6,294	5,923	1,349	1,498	2,603
Dividends paid	3,886	4,297	4,557	4,795	4,999
Share repurchases	527	3,615	293	929	1,477
Depreciation & amortization	954	979	1,238	1,580	1,999

Source: Company 10-K filings. Free cash flow calculated by the analyst as operating cash flow less capital expenditure, per the standard definition. TI's own reported non-GAAP free cash flow figure of \$2.94 billion for 2025 (16.6% of revenue) differs from the \$2.60 billion calculated here because the company's own definition adds back proceeds from U.S. CHIPS and Science Act incentives, which are excluded from the analyst's calculated figure above.

The central finding of the cash flow analysis is that **net income has materially exceeded free cash flow in every year since 2022**: cumulative net income of \$23.6 billion over 2022-2025 compares with cumulative free cash flow of just \$11.4 billion over the same period, a gap almost entirely explained by \$17.2 billion of cumulative capital expenditure against \$5.8 billion of cumulative depreciation. In 2023, free cash flow of \$1.35 billion did not even cover the \$4.56 billion dividend paid that year; the shortfall was funded by new debt issuance rather than a dividend cut, a pattern management continued through 2024. This dividend-coverage gap, funded by the balance sheet rather than free cash flow, was a legitimate point of financial-quality scrutiny in those years, even though the dividend itself continued to grow throughout.

The gap has narrowed markedly since: on a trailing-twelve-month basis through Q2 2026, TI reported operating cash flow of \$8.67 billion against capital expenditure of only \$3.31 billion, producing company-defined free cash flow of \$6.53 billion, or 33.6% of trailing revenue, comfortably ahead of the \$5.82 billion returned to shareholders over the same twelve months.¹⁰ The improvement is driven overwhelmingly by capital expenditure: TTM capex of \$3.31 billion is already well below the FY2025 full-year level of \$4.55 billion and the FY2023-2024 peak of roughly \$4.8-5.1 billion, indicating the capex cliff central to this report's investment thesis is already underway ahead of the pace assumed in the base-case DCF scenario in Section C5. This is the single most important trend to confirm or disconfirm in coming quarters.

C4. Forecasting and Projections

The forward-looking analysis below is **Reasoned**: the analyst's own scenario construction, not a company forecast, guidance figure, or consensus estimate, except where explicitly cited as such. TI provides only next-quarter guidance publicly (Q3 2026 revenue guidance of \$5.65–\$6.15 billion and EPS guidance of \$2.23–\$2.57, both well above Q2 2026 actuals, consistent with continued sequential recovery).¹⁰

Revenue modeling. The base case assumes the current cyclical recovery continues but decelerates from the H1 2026 run-rate (+20.8% YoY) toward a more sustainable high-single-digit pace in year one, tapering to a mid-single-digit terminal rate by year five as the industrial/automotive restocking cycle completes and growth reverts to a blend of unit proliferation (vehicle electrification, industrial automation) and new data-centre power demand.

Margin projections. Operating margin is modeled to expand from a starting point near the H1 2026 actual (40.0%) toward the mid-40s percentage range by year five as new fab capacity is increasingly absorbed by higher volume, still below the 2021-2022 peak (48.9-50.6%) to reflect a structurally higher depreciation base going forward.

Capital expenditure and working capital. Capex is modeled to decline from its cyclically elevated 2025 level (25.7% of revenue) toward the low-teens percentage of revenue by year five as the current wave of Sherman fab construction is substantially completed, consistent with TI's own historical pre-build-out capex intensity in the low-to-mid teens. Working-capital investment is modeled as a small, declining draw on cash as inventory growth normalizes with revenue.

C5. Discounted Cash Flow Model

The DCF below uses a five-year explicit forecast plus a Gordon-growth terminal value, discounted at a Reasoned weighted average cost of capital of approximately 10.9%, built from a risk-free rate of 4.72% (10-year U.S. Treasury yield, August 17, 2026, the most recent available observation), TI's reported beta of 1.33, an assumed 5.0% equity risk premium, and an after-tax cost of debt of approximately 3.1% derived from reported interest expense on average total debt.¹¹ Terminal growth is assumed at 2.5%. All three scenarios use a starting revenue base of \$19.45 billion (trailing twelve months) and net debt of \$10.4 billion.

DISCOUNTED CASH FLOW SCENARIOS: KEY ASSUMPTIONS AND RESULTING VALUE PER SHARE

Assumption / Output	Bear	Base	Bull
Revenue CAGR, years 1-5	~3.0%	~8.1%	~11.5%
Operating margin, year 5	37%	46%	50%
Capex, year 5 (% of revenue)	15%	11%	10%
WACC	12.0%	10.9%	10.0%
Terminal growth	2.0%	2.5%	3.0%
Implied value per share	~\$46	~\$106	~\$168

Reasoned/illustrative model built by the analyst; not a company forecast. Implied values are before any control premium and reflect a standalone, publicly-traded-equity basis.

BASE-CASE SENSITIVITY: IMPLIED VALUE PER SHARE BY WACC AND TERMINAL GROWTH RATE

WACC \ Terminal Growth	1.5%	2.0%	2.5%	3.0%
9.5%	\$117	\$123	\$131	\$140
10.0%	\$109	\$115	\$121	\$129
10.9%	\$96	\$101	\$106	\$112
11.5%	\$89	\$93	\$98	\$103
12.5%	\$80	\$83	\$86	\$90

What the current price implies. Even the bull-case scenario above, which assumes a sustained double-digit revenue CAGR, operating margins reaching 50% (exceeding TI's own 2021-2022 historical peak of 50.6%), and capex falling to 10% of revenue, produces a value of approximately \$168 per share, roughly 37% below the August 19, 2026 closing price of \$267.45. Reconciling the model to the market price would require some combination of: (i) growth and margin trajectories more optimistic than the bull case modeled here sustained over a longer explicit period; (ii) a materially lower discount rate

than the 10.0-10.9% used here, which would be consistent with the market assigning TI a lower risk premium than its historical beta would suggest, perhaps reflecting its domestic-manufacturing and AI-data-centre-power positioning; or (iii) strategic or optionality value (e.g., long-duration AI-related power-semiconductor demand, or the value of domestic supply-chain resilience amid geopolitical tension) not captured in a standard five-year explicit FCFF forecast. **This is an observation about embedded market expectations, not a prediction of future price direction.**

C6. Leveraged Buyout Considerations

A traditional leveraged buyout framework is not a meaningful analytical lens for Texas Instruments and is included here only for completeness. At a \$244 billion equity value, TI sits far outside the size range in which LBO sponsors and their debt markets typically operate; more importantly, the business is presently consuming, not generating, the kind of stable, capital-light free cash flow that underpins LBO debt-service capacity: FY2025 free cash flow of \$2.60 billion against \$15.4 billion of existing gross debt would leave essentially no capacity for incremental LBO leverage without either a multi-year pause in the capex program (which would itself undermine the long-term competitive-advantage thesis) or a material, uncertain acceleration in the capacity-utilization recovery. A private-equity owner would also face the same structural question equity investors face today: whether the returns on the roughly \$60 billion committed fab investment programme will exceed its cost of capital, which is precisely the open question this report's DCF analysis is built to frame rather than resolve.

D. Investment Thesis

Bull Case

TI's capex program peaks and begins a sustained decline as a percentage of revenue starting in 2026-2027, as evidenced by the H1 2026 capex decline already visible in the data; the new 300mm capacity is absorbed by continued industrial and automotive recovery plus a genuinely large, multi-year AI data-centre power-semiconductor demand cycle; operating margin re-approaches or exceeds its 2021-2022 peak as fixed-cost absorption improves; free cash flow accelerates sharply, allowing accelerated buybacks alongside continued dividend growth; and the market sustains or expands today's premium multiple on the back of visible, delivered margin recovery.

Bear Case

The industrial/automotive recovery stalls or proves shorter-lived than the H1 2026 data suggests; new 300mm capacity remains underutilized for longer than expected, keeping gross and operating margins compressed; capex fails to moderate as planned, keeping free cash flow structurally below net income and dividend coverage; net debt continues to rise toward levels that pressure the investment-grade rating; China's anti-dumping investigation results in punitive tariffs that impair a meaningful share of the roughly 20%-of-revenue China business; and the market re-rates the stock back toward its historical 17-30x trailing P/E range from a starting point of disappointing rather than accelerating earnings, producing substantial multiple compression on top of any earnings shortfall.

Base Case

Revenue growth decelerates from the H1 2026 pace toward a high-single-digit rate over the next one to two years as the restocking-driven portion of the recovery fades, settling into a mid-single-digit longer-run trajectory consistent with the industry's underlying structural growth rate. Operating margin recovers gradually, aided by moderating capex and rising utilization, but takes several years to approach the 2021-2022 peak. Free cash flow improves steadily from the 2023-2024 trough but remains below net income for a period while the fab build-out completes. The dividend continues to grow, funded increasingly by cash flow rather than incremental debt as the capex cycle matures. Under these assumptions, the DCF analysis in Section C5 implies a value meaningfully below the current market price, suggesting the base case alone would not obviously justify today's valuation without further multiple support from continued sector-wide sentiment.

Catalysts

- Quarterly earnings releases, particularly evidence of continued margin recovery and a declining capex-to-revenue ratio (next report: Q3 2026, per company guidance of \$5.65-6.15bn revenue).
- Further disclosure on the pace and ultimate scale of the Sherman, Texas fab ramp and associated utilization economics.
- Resolution (favorable or unfavorable) of China's anti-dumping investigation into U.S. analog chips.
- Data-centre/AI power-semiconductor design wins and revenue disclosure, a newly emerging growth vector for TI.
- Federal Reserve interest-rate path, given TI's elevated and still-growing debt load and its sensitivity to the cost of capital embedded in the current premium valuation.

Things to Monitor

Metric / Event	Why It Matters	Positive Signal	Negative Signal
Capex as % of revenue	Direct driver of free cash flow and the central swing factor in the investment case	Sustained decline toward historical low-teens range	Persistently elevated or rising further
Operating margin	Signals whether new capacity is being absorbed profitably	Sequential expansion toward 2021-2022 levels	Stalled or renewed compression
Free cash flow / net income	Tests whether reported earnings are being converted to distributable cash	Ratio rising back toward 1.0x or higher	Ratio remaining well below 1.0x
Net debt / EBITDA	Financial flexibility and rating headroom	Stabilizing or declining from 1.47x	Continued increase toward 2x or beyond
Inventory levels	Distinguishes strategic capacity buffer from unsold demand weakness	Inventory growth decelerating below revenue growth	Continued inventory growth outpacing revenue
China anti-dumping investigation	Directly threatens ~20% of revenue	Resolution without material tariffs	Punitive tariffs or further escalation
Industrial and automotive order trends	Primary demand drivers, two-thirds of revenue combined	Continued sequential growth	Renewed inventory correction or order softness

E. Final Investment Framework

BUSINESS QUALITY	High. A diversified, non-customer-concentrated analog and embedded-processing franchise built around design-in switching costs and an unusually broad product catalogue.
FINANCIAL QUALITY	Currently mixed. Strong absolute profitability and an investment-grade balance sheet, but free cash flow has trailed net income for four consecutive years and the dividend has been funded partly by debt rather than free cash flow.
COMPETITIVE POSITION	Structurally strong and improving. Internal 300mm manufacturing is a genuine, difficult-to-replicate cost advantage once fully utilized.
MANAGEMENT	Continuity-oriented and internally promoted; has prioritized the dividend and the capacity build-out simultaneously, funding the gap with the balance sheet rather than cutting shareholder returns.
INDUSTRY	Mature and moderately cyclical, presently in a broad-based recovery from a 2023-2024 inventory correction, with new secular demand emerging from vehicle electrification, industrial automation and AI data-centre power.
VALUATION	Demanding by both historical and peer standards; the Reasoned DCF analysis implies a value below the current market price even under bull-case assumptions.
TECHNICAL AND MARKET STRUCTURE	Strong positive momentum and trend structure (price above both 50- and 200-day moving averages over most of the trailing year), consistent with an active, sector-wide semiconductor re-rating.
PRINCIPAL RISK	New 300mm capacity is not absorbed by proportionate revenue and margin recovery over the next several years, leaving returns on invested capital structurally depressed.
PRINCIPAL CATALYST	A sustained, visible decline in capex as a percentage of revenue combined with continued operating-margin recovery.
KEY VARIABLE	The trajectory of operating margin and free cash flow conversion as the Sherman, Texas fab complex ramps: the single variable that most directly separates the bull, base and bear cases in this report.
THESIS INVALIDATION	The investment thesis would become materially weaker if capital expenditure fails to decline toward the low-teens percentage of revenue within the next two to three years, if operating margin fails to resume expanding from its current mid-30s percentage level, or if net debt/EBITDA rises materially above its current 1.47x without a corresponding acceleration in free cash flow.

F. Data Table

STANDARDIZED COMPANY SNAPSHOT

Category	Metric	Current	Prior Year (FY2024)	5-Year Trend
Market	Market capitalization	\$244.2bn	\$225.3bn (Aug 2025 spot)	Up sharply on 2026 re-rating
Market	Enterprise value	\$254.6bn	n/a	Rising with debt and market cap
Market	Share price	\$267.45	\$245.15 (Aug 19, 2025)	52-wk range \$152.73-\$334.03
Growth	Revenue growth (YoY)	+13.0% (FY25)	-10.7% (FY24)	V-shaped: -21.9% peak-to-trough, then recovery
Profitability	Gross margin	57.0% (FY25)	58.2% (FY24)	Down from 68.8% (2022 peak)
Profitability	Operating margin	34.1% (FY25)	34.9% (FY24)	Down from 50.6% (2022 peak)
Profitability	Net margin	28.3% (FY25)	30.7% (FY24)	Down from 43.7% (2022 peak)
Profitability	ROE	30.7% (FY25)	28.4% (FY24)	Down from 60.0% (2022 peak)
Profitability	ROIC	19.3% (FY25)	18.3% (FY24)	Down from 46.9% (2021 peak)
Cash Flow	Operating cash flow	\$7.15bn (FY25)	\$6.32bn (FY24)	Range \$6.3-8.8bn since 2021
Cash Flow	Free cash flow	\$2.60bn (FY25)	\$1.50bn (FY24)	Down from \$6.3bn (2021), recovering
Leverage	Net debt / EBITDA	1.47x (FY25)	1.57x (FY24)	Up from 0.36x (2021)
Valuation	P/E (TTM)	40.6x	n/a	Above 5-yr range of ~17x-37x
Valuation	EV/EBITDA (TTM)	26.7x	n/a	Elevated vs. most direct peers
Valuation	P/FCF (TTM, company-reported)	37.4x	n/a	~94x on FY25A alone; improving sharply as capex falls
Market	Beta	1.33	n/a	Consistent with cyclical semiconductor manufacturer
Market	52-week range	\$152.73-\$334.03	n/a	Reflects 2026 earnings recovery and sector re-rating

Calculations

The following metrics were calculated by the analyst rather than sourced directly: free cash flow (operating cash flow less capital expenditure), net debt (total debt less cash and short-term investments), net debt/EBITDA, current ratio, working capital, gross/operating/net margins, return on equity, return on invested capital (NOPAT divided by average invested capital, using the reported effective tax rate), effective tax rate, enterprise value, all valuation multiples derived from market capitalization or enterprise value, historical period price returns, and the discounted cash flow model and sensitivity tables in Section C5. All Reasoned assumptions and estimates are explicitly labeled as such in the body of the report and are the analyst's own construction rather than company guidance or third-party consensus, except where a consensus estimate is explicitly cited.
